Attorney Docket: 678-638 (P9799)

## **AMENDMENTS IN THE CLAIMS**

1. (Currently Amended) A method of encoding input information of k-bits and generating a codeword with length  $N > (2^k-1)$ , comprising the steps of:

encoding the input information using a (r, k) simplex code and generating a sequence of code symbols of length  $\mathbf{r}$   $(r=2^k-1)$ ;

repeating the sequence of code symbols t times 
$$(t = \left| \frac{N}{r} \right| + 1)$$
; and

puncturing A times (A = rt-N) on the t repeated code symbol sequences so that the resulting codes have length N,

wherein the puncturing is performed in a same position of each sequence with the length N.

- 2. (Original) The method of claim 1, wherein the punctured symbols are distributed uniformly across the repeated code symbol sequences.
- 3. (Original) The method of claim 1, wherein the punctured symbols are confined to the t<sup>th</sup> repeated code symbol sequence.
- 4. (Currently Amended) An apparatus for encoding input information of k-bits sequence and generating a codeword with length  $N > (2^k-1)$ , comprising:

an encoder for encoding the input information using an (r, k) simplex code and generating a sequence of code symbols of length r  $(r=2^k-1)$ ;

a repeater for repeating the sequence of code symbols t times 
$$(t = \left\lfloor \frac{N}{r} \right\rfloor + 1)$$
; and

a puncturer for puncturing A times (A = rt-N) on the t repeated code symbol sequences so that the resulting codes have length N,

wherein the puncturing is performed in a same position of each sequence with the length N.

- 5. (Original) The apparatus of claim 4, wherein the punctured symbols are distributed uniformly across the repeated code symbol sequences.
- 6. (Original) The apparatus of claim 4, wherein the punctured symbols are confined to the t<sup>th</sup> repeated code symbol sequence.
- 7. (Currently Amended) An encoding method comprising the steps of: encoding input information using a (7, 3) simplex code and generating a sequence of code symbols of length 7;

repeating the sequence of code symbols **t** times  $(t = \left\lfloor \frac{N}{r} \right\rfloor + 1)$ ; and

performing puncturing A times (A = rt-N) on the t repeated code symbol sequences in a predetermined puncturing pattern so that the resulting codes have length N that is not a multiple of 7,

wherein the puncturing is performed in a same position of each sequence with the length N.

- 8. (Original) The encoding method of claim 7, wherein if the remainder of dividing the N by 7 is 1, the predetermined puncturing pattern is set to puncture six arbitrary symbols.
- 9. (Original) The encoding method of claim 7, wherein if the remainder of dividing the N by 7 is 2, the predetermined puncturing pattern is set to puncture five arbitrary symbols.
- 10. (Original) The encoding method of claim 7, wherein if the remainder of dividing the N by 7 is 3, the predetermined puncturing pattern is set to puncture the third, fifth, sixth, and seventh

Attorney Docket: 678-638 (P9799)

symbols of the t<sup>th</sup> repeated code symbol sequence.

- 11. (Original) The encoding method of claim 7, wherein if the remainder of dividing the N by 7 is 4, the predetermined puncturing pattern is set to puncture the third, fifth, and sixth symbols of the t<sup>th</sup> repeated code symbol sequence.
- 12. (Original) The encoding method of claim 7, wherein if the remainder of dividing the N by 7 is 5, the predetermined puncturing pattern is set to puncture two arbitrary symbols.
- 13. (Original) The encoding method of claim 7, wherein if the remainder of dividing the N by 7 is 6, the predetermined puncturing pattern is set to puncture one arbitrary symbol.
- 14. (Original) The encoding method of claim 7, wherein if the remainder of dividing the N by 7 is 3, the predetermined puncturing pattern is set to puncture the  $(n1\times7+3)^{th}$ ,  $(n2\times7+5)^{th}$ ,  $(n3\times7+6)^{th}$ , and  $(n4\times7+7)^{th}$  symbols of the repeated code symbols  $(0 \le n1, n2, n3, n4 \le (t-1))$ .
- 15. (Original) The encoding method of claim 7, wherein if the remainder of dividing the N by 7 is 4, the predetermined puncturing pattern is set to puncture the  $(n1\times7+1)^{th}$ ,  $(n2\times7+2)^{th}$ , and  $(n3\times7+3)^{th}$  symbols of the repeated code symbols  $(0\le n1, n2, n3\le (t-1))$ .
- 16. (Previously Presented) The method of claim 1, wherein the k-bits sequence is information indicating a data rate of a mobile station.
- 17. (Previously Presented) The apparatus of claim 4, wherein the k-bits sequence is information indicating a data rate of a mobile station.

**PATENT** 

Attorney Docket: 678-638 (P9799)

18. (Previously Presented) The encoding method of claim 7, wherein the input information indicates a data rate of a mobile station.
